Gravity Shapes Lattice Through Electron Magnetism — Hydrogen Coherence Addendum

In continuation of the September 2025 FUNt Supplement, “Gravity Shapes Lattice Through Electron Magnetism,” this addendum integrates the hydrogen coherence principle as the foundational source of the lattice. 1. Hydrogen coherence establishes the universal phase field — the source of all electron magnetic alignment. 2. Electron magnetism shapes the lattice geometry — forming self-sustaining harmonic scaffolds. 3. The emergent strain of this coherent magnetic lattice manifests macroscopically as gravity. Thus, gravity is not a primary force but the emergent geometry of hydrogen’s magnetic coherence — the shadow cast by aligned electron magnetism across the universal web. In this model: • Hydrogen serves as the phase-locked origin of lattice resonance. • Electron dipoles express this resonance magnetically. • Gravitational curvature arises as the large-scale strain of that magnetic coherence. In unifying hydrogen coherence with electron magnetism, the Wave-Web Resonance framework becomes complete: hydrogen weaves the lattice, electrons sculpt its magnetic form, and gravity emerges as the visible echo of their coherence.
